Chapter 1 — Understanding Digital Skills

Digital skills are the abilities you use to work, learn, communicate, create, and solve problems with digital devices and online services.

What counts as a digital skill?

Examples include typing, file management, internet research, email, document creation, spreadsheets, presentations, social media, basic design, video editing, AI-assisted work, and online communication.

The goal is not to learn everything at once. Pick one useful skill, practice it repeatedly, and create small projects that prove you can use it.

Skill + practice + proof

A useful formula for beginners is: Learn → Practice → Create → Show. Watching tutorials is learning; making a real post, document, design, or video is practice and proof.

Clients and employers usually care about what you can actually do. A small portfolio can therefore be more useful than a long list of courses.

Choose a starting skill

If you enjoy writing, start with content writing or copywriting. If you enjoy visuals, try simple graphic design or video editing. If you like organizing information, learn spreadsheets and virtual-assistant tasks.
